

MSI MEG Z490I UNIFY als Hackintosh

Beitrag von „malibio“ vom 27. September 2020, 00:35

Perhaps the optimist in me is hoping that Apple will support the Intel AX201 card in the future (natively). Of course, I'm not holding my breath for it. In the meantime, I don't have a strong need for Airdrop nor Sidecar. If I do decide to add a compatible WiFi card later, would you mind sharing how you set yours up? Which adapter did you get with the BCM943602CS card? And as asked by @dreary, did you use the M.2 slot on the back or front of the MB? How did you run the antenna wires? If you're able to share images, even better!

However, the more general question I have, besides the WiFi solution, did everything else work out with your build? Any tips I need to look out for? Or are the instructions on the OpenCore guide sufficient?

Thanks in advance for any guidance you're able to offer.
