GA-H81M-S2H Shutdown Problem in Catalina

Beitrag von „amgm1971“ vom 6. Januar 2021, 22:30

Hello, after many years I have found these messages that have helped me a lot. I have my old GA H81M-S2H with Mojave 10.14.6 working great thanks to you guys.

Now I only have a small problem that I can't solve, like editing that DSDT that was put here, so that I can wake up from the dream with the keyboard, now you sleep well but you only wake up with the button on the box.

I have tried USB options with clover and nothing works. If I remove the DSDT if it works but some USB does not go.

It is a matter of the DSDT but I don't know how to do it, the DSDT edition is very complicated for me.

Can you help me?? I would appreciate it SO MUCH

Here I upload the DSDT and my clover folder

SORRY FOR MY ENGLISH GOOGLE
