Terminal `man pmset`

`hibernatemode = 25` is only settable via `pmset`. The system will store a copy of memory to persistent storage (the disk), and will remove power

to memory. The system will restore from disk image. If you want "hibernation" - slower sleeps, slower wakes, and better battery life, you

should use this setting.

Please note that `hibernatefile` may only point to a file located on the root volume.
