

Big Sur - OpenCore von 0.59 auf 0.72

Beitrag von „HAI“ vom 24. August 2021, 23:32

Bin jetzt schon ein paar Tage auf Big Sure.

Habe nun auf "0.7.2" umgestellt opencore.efi war "0.5.9" ist aber jetzt egal, weil es ja jetzt funktioniert. Plist war "0.6.9".

Habe nur eine Sache geändert und das war die "Hfs+.efi" die wurde wohl nach "OpenHfs+.efi" umgestellt.

Wie [ozw00d](#) mir empfohlen hat, habe ich sowohl "OCCompare" als auch "OCvalidate", wie gesagt es funktioniert alles.

Ich möchte nur wissen ob ich hierfür nachsteuern muß.

Vielleicht wird das ja in kommenden Versionen wichtig.

Hier einfach die Outputs.

Danke.

```
h@hackintosh:~/Downloads/OpenCorePkg-master/Utilities/ocvalidate > ./ocvalidate /Volumes/EFI/EFI/OC/config.plist
OC: Missing key SyncTabSize, context <Quirks>!
OC: Missing key Delete, context <DeviceProperties>!
OC: Missing key CustomKernel, context <Schema>!
OC: Missing key GraphicsInputMirroring, context <AppleInput>!
Serialisation returns 4 errors!
Completed validating /Volumes/EFI/EFI/OC/config.plist in 3 ms. Found 4 issues requiring attention.
```

```
