[fabiosun](#)

I know that benchmarks don't actually measure real world performance, but although the results may vary from run to run, even on the same system, we're only talking about slight differences. I asked for Geekbench results to check if my own figures differ significantly here too. Since your machine has far more PCIe lanes and uses PCIe4 thanks to the Threadripper CPU, it makes total sence that your results are a lot higher (what's interesting though is, that my Metal score is almost the same as yours).

On the other hand [Aluveitie](#) system should at least benefit from the PCIe4 capabilities of his processor but still his RawSpeedTest results almost correspond to mine.

Therefore I think we can neglect the Geekbench results, since the vary too much from run to run (but at least almost match at their peak). But RawSpeedTest seems to be much more reliable. Where I get about 104fps every time i try, [toasta](#) gets between 170 and 180 everytime he tries, although our rigs are only one generation apart, with mine beeing the newer one.

So what does his system have, that mine and Aluveities systems don't?
