## **iMac 27/Late 2014 - OpenCore - is that right?**

**Beitrag von „Planaxator“ vom 21. Dezember 2021, 08:39**

Hi guys - today i had some time and i decided to make a clean install with monterey on my imac 27/late2014. I had already an update on it with Monterey 12.0.1 and it runs without problems... But, how i said, i had a lot of time and my baby got bsincw end 2014 NEVER a nice &n clean install... i made a USB-STICK with Monterey 12.1 release and patched it with the opencore 0.3.3. So far, everything went good, and after 3, up to 4 reboots Monterey booted and everything worked - i reinstalled now a lot of software - i also backed up some files i need, you see everything is cool.. But, maybe 30 min ago i took a look with the apples build in software for harddisks- don't know what's the name now. -and there is one partition not activated. I already tried to "activate" it with the hatddisk software, but doesn't work. i made a screenshot, so you can see what i mean... Maybe is that normal? i don't know-that's why i need you for assistance :)) So here you get the screen...

[22:45]

...oh it was, or maybe it is still a fusion drive 128/1000. Here you get a

Picture, so you can see what I'm complain about ....

do you really think? I'm not sure, but what it was "only updated" i did not see the not highlighted harddisc/partition, whatever.. :)) also, i did nowhere see something like that?! ...and be sure, i saw a lot of how it was before i start with... But, i assume we know what's going on. Do you have the same? and how or where can i see if the fusion drive is still intact? thank you. 😊
