

# **5950x + Asus ROG Crosshair VIII EXTREME X570: bitte kontrollieren und vervollständigen**

**Beitrag von „fabiosun“ vom 14. Januar 2022, 09:12**

hello [davorrr](#)

I apologize from the start as the google thread translation could be the cause of some nuance that I missed

To date if you can spend the money, the best machine you can make would be a TRX40 threadripper for your audio tasks and especially if you are willing to waste time on it.

I would also recommend a threadripper for the fact that you are talking about virtualization to avoid incompatibility problems with some audio plugins

Premise

To date, all the incompatibilities that I have faced can be resolved with a little patience and with simple patches

But there is some work to be done

I went from a sage 10g X299 with 7980xe as I was bored by the constant "useless" refreshes from Intel (9980xe, 10980xe) and I have never regretted it

If you also have as an option in the negative case that what you need does not work well in OSX and you can use Windows ... I would have no doubts

Having a multiple system, both virtual and bare metal is very simple

About ProxMox and Unraid

personally I have worked a lot with Proxmox and over the years I have produced a guide that you can find in the International section of an Italian forum

I don't know if I can post the link, you will also find many videos made to demonstrate the perfect functioning of both Audio programs such as logic and video Editing (Premiere Pro Davinci, Red and so on)

However, for audio processing I don't feel like recommending virtualization as you could have problems if you stress your system to the maximum.
