`Erledigt` Thinkpad E130 OC Install & vieles mehr

Beitrag von „Pi88no" vom 15. März 2022, 09:07

If I remember correctly, I also had the problem at the beginning that it failed with an ACPI error. The reason was that the laptop wants to read the battery values with the help of smcbatterymanager, but this failed because the ssdts was still faulty or was it the battery patch? 🤔

So I think it will be easier if you first try to install macOS with a minimal EFI. For the installation you don't need a working battery manager.

You can either use the OC Guide + my ready EFI as a help OR you use my old EFI with which I did the installation back then (macOS 11.5.1).

Also important that your BIOS settings are correct... also here you can find help in the OC Guide.
