[OSX-Einsteiger](#) Problem is not to be a guru or not! 😊

User has a perfect EFI in Big Sur with an updated Opencore Bootloader

The same EFI should be able to install also Ventura OSX

Instead he has a KP before Darwin is set

Probably he should try to start with a minimal set of Kexts and SSDTs

And to be sure he downloads well OS is trying to install

as side note I would leave out Dortania guide and MMIO about his platform! 😊
