for now you do not need to spoof anything

If you will buy a 6950XT pr a 6900 XT XTHX you must spoof device id to a supported one

3080 is not supported

it means no drivers for it and no acceleration (no spoof and so on)

if you use a recovery USB installer you must insert in Kext a proper Kext for ethernet card I think this one:

LucyRTL8125Ethernet.kext

do not use WIFI to install because you have to find a right combination for your intel hardware
