

Neues Mainboard für AMD

Beitrag von „GoodBye“ vom 12. Oktober 2022, 17:51

[fabiosun](#)

i understood it as such:

I would try before to see if also yours is affected of this serious problem, the or Asus, Gigabyte, ASRock it is up to you the choice

I have had for few time an Asrock x570 Steel legend

Simple to configure

Main thing to consider for a new buy is if the internal lan is working or not with OSX greater than big Sur

There are People having success with the i211AT i heard, but as you wrote, buy USB LAN OOB Driverless (most Realtek) and [Fenvi](#) for WLAN + BT or [ASUS PCE-AC68](#) and [IOGear GBU521](#)

I had selected my Board specifically for non Intel Lan (**Realtek RTL8125B** Z490 and i5 10400 for UHD630) to get it working as near as possible to last Intel Macs.

Realtek RTL8125B is also avail as USB version to get 2,5GB Lan (but did not test it by myself)
