@[greecedrummer](#) Have you tried the latest BIOS F22?
I heard alot of good things

Only good for the Windows and Linux world. Since Gigabyte has written additional code for security from F20, OpenCore does not succeed in saving the entry to start on the desired BootDevice and only ends up in the first possible place where you have set MISC / security / ScanPolice! So far only F8 works properly with OpenCore. However, if you don't need any boot options and control everything via the BIOS boot menu, you can use F20. At least my experiences with the 12900KF CPU, if you have a 13th generation CPU and achieve other results, of course everything remains open!
