Was muss ich nun genau an der patches.plist verändern damit die Beta 2 13.3 auf einem AMD läuft?

OpenCore nutze ich 0.90

you do not need latest opencore

It is mandatory to use 'new' corecount patch

It is the forth of vanilla AMD patches config plist

Obviously you have to modify it based on your cpu core count

The old patches you used would always work with older os

You should also change goldfish patch for 12.0 and 13.0 OSs with the 'new' one posted in vanilla patches GitHub named goldfish64/alg

If you have some doubts post your config.plist if you like
