Frank

Your cpu is a six core one

You have to modify hecatomb Efi because his EFI is done for a 12 cores cpu

So you have to adjust kernel patches values from 0c to 06

then a laptop is a big challenge

You could have some change to have gpu acceleration using nootered kext without using whavergreen kext

Some laptop users install their system initially booting in vesa mode and then using nootered kext to try to have it accelerated
