

In Arbeit

macOS Installation auf ASUS B550 CREATOR mit Ryzen 7 3700X & RX 5700XT

Beitrag von „fabiosun“ vom 26. Oktober 2025, 08:31

[Charon233](#) as expert mods said, opening different discussion is not good because people who tries to help must search on other threads all the tries we are doing to have this pc working

Now, some questions:

- 1) how do you create your USB installer (if you are installing from an USB sticks as in the past)
- 2) Is it the same disk where you installed before? if so how do you format this? guid/APFS or how?
- 3) Have you tried to do from scratch the USB installer?
- 4) USB mapping is a task that only the owner of this PC could do. if it is not perfect it could happen that during installetion steps system looses USB ports and it could have weird behaviour

I wouldnt add others variables as beta opencore version before you win this challenge with your hardware

EDIT:

try to have the same conditions you had here :

[macOS Installation auf ASUS B550 CREATOR mit Ryzen 7 3700X & RX 5700XT](#)

with a sequoia working conditions (EFI,Bios parameters) usually is pretty simple to update to Tahoe Os
