Hi [@Sofista](#)

Your question doesn't belong to our "Manuals"-Section, so I moved it to the "Hardware Compatibility"-Section.

Please do not use any of the "Manuals"-Sections for your requests/questions.

This motherboard that you use .. do not need to edit DSDT and SSDT ..?

Actually most, if not all, Motherboards need DSDT edits to achieve a maximum compatibility with os-x. Some may work more or less ootb but if it comes to details such as sleep or speedstepping as well as sound support you need to edit the DSDT to provide the correct device properties for OS-X.
