Ozmosis modified rom

Beitrag von „nrchandar0100“ vom 15. Oktober 2017, 09:10

Hi,

My mother board is Z97 D3H and when i tried ti insert the modified Ozmosis rom for high sierra, to the mother board the inserting went on well when i reboot it shows nothing and some time a cross in a round. why this happen?

Thanks

Please have in mind that everytime you flash a new ROM all [Bios settings](#) are lost and have to be adjusted again. Make sure your HDD mode is set to AHCI, Vt-D, if available, is turned off and Graphics is selected properly also make sure that you might need to create an own defaults.plist to configure OZ to fit your needs (eg PlattformID for iGPU or DisabaleNvidiaInjection set to false for some NVIDIA Cards)...
