Need help with MSI Z97 Gaming 7

Beitrag von „MrTrip“ vom 18. Mai 2018, 01:11

So I'm not having any luck with creating my own flash... every single time I do I get an F2 Bios error, damaged bios.

I can take an already working [BIOS flash](#), extract OZM from it and then recreate it and it is still corrupted.

I've been working on this for the past 12 hours and I have no idea what is wrong....

I've downloaded the latest bios from MSI, I tried to apply Ozmosis to it, once I get that applied I flash the BIOS and I get an F2 error. The High Sierra ready BIOS here in the downloads section also has the same error. The previous bios does not, but I have no sound with that because it does not have the VoodooHDA module loaded....

Not sure what to do now =\

Hallo [@MrTrip](#) und Willkommen im Hackintosh Forum. 😊

Versuche es mal bitte mit dem Ozmosis rom aus dem Anhang, das UnSolid.kext muss dazu in der EFI abgelegt werden.

Edit: Zusätzlich im Anhang ein Ozmosis rom APFS.

- ohne KernelPatcher
- ohne DisablerKext
- ohne InjectorKext

- ohne CPU, LPC, GPU Sensors
-

Danke! However, both of these files produce the "F2: Damaged Bios" error that I have been having with all BIOS created for High Sierra....

Beitrag von „MrTrip“ vom 20. Mai 2018, 15:05

Well, I figured it out. Dumping OZMTool on its face and using UEFITool I was able to inject Ozmosis and the things I needed, and all was well and good. Flashed, and currently back on Sierra. High Sierra was becoming a pain so I just went back to what is familiar 😊
