

Have troubles with power management

Beitrag von „firefly_can_fly“ vom 10. Dezember 2020, 22:54

Hi, recently I've updated to OC 0.6.4, but still have problems with power management/CPU.

I don't understand how properly turn on it with e3-1245 V3 Xeon.

Can someone please take a look at my config, I want to gully go for OC.

In archive, there's IOreg, EFI folder, and ssdt that I made with the script, but don't understand how to properly redact.
